Feedback and Constraint

1) Maggi (Constraint Not Followed)

Maggie claims itself to be a 2 min noodle and also provides a recipe to cook it. But hardly anyone follows it then mixes it with cheese/paneer/eggs/chicken and so on. And no one makes it in 2 minutes. So hence it is an example of constraint not followed.

2) Clothing items (constraints followed)

Usually, the clothing brands provide some precautions to be taken while ironing, washing, or handling a clothing item. And generally, the people follow those for a better life of clothes. as an example given in the above picture, there are precautions provided about the temperature of iron and washing items used.

3) TV Volume (Constraints)

So the TV speakers can get up to a very big noise. But TV companies have capped to volume unit till 32. So it won't affect the hearing of people. and will not cause any harm to them. And their experience with the TV will be good.

4) Kitchen Utensils (Feedback required)

Sometimes while working in the kitchen the kitchen utensils used tend to remain hot. Or sometimes they aren't hot as they are required for something. So it could cause problems like getting burnt, getting hurt by the hot utensils. Or messing up the recipe if the utensils aren't hot enough. So I think the utensils brand should make an indicator for utensils using the thermometer or something close to that to give visual feedback about the temperature of utensils

5) Trimmer (Feedback required)

So this is my Phillips trimmer it has around 60 mins of runtime after charging but there is no physical/visual indicator for battery life so its battery gets drained randomly and I have to face issues for charging it again and again. So i think company should provide a battery life indicator
